## **Experiment No. 11**

Aim: To use google Lighthouse PWA Analysis Tool to test the PWA functioning.

Theory:

## **Google Lighthouse:**

Google Lighthouse is a tool that lets you audit your web application based on a number of parameters including (but not limited to) performance, based on a number of metrics, mobile compatibility, Progressive Web App (PWA) implementations, etc. All you have to do is run it on a page or pass it a URL, sit back for a couple of minutes and get a very elaborate report, not much short of one that a professional auditor would have compiled in about a week.

The best part is that you have to set up almost nothing to get started. Let's begin by looking at some of the top features and audit criteria used by Lighthouse.

## **Key Features and Audit Metrics**

Google Lighthouse has the option of running the Audit for Desktop as well as mobile version of your page(s). The top metrics that will be measured in the Audit are:

- 1. **Performance:** This score is an aggregation of how the page fared in aspects such as (but not limited to) loading speed, time taken for loading for basic frame(s), displaying meaningful content to the user, etc. To a layman, this score is indicative of how decently the site performs, with a score of 100 meaning that you figure in the 98th percentile, 50 meaning that you figure in the 75th percentile and so on.
- 2. **PWA Score (Mobile):** Thanks to the rise of Service Workers, app manifests, etc., a lot of modern web applications are moving towards the PWA paradigm, where the objective is to make the application behave as close as possible to native mobile applications. Scoring points are based on the Baseline PWA checklist laid down by Google which includes Service Worker implementation(s), viewport handling, offline functionality, performance in script-disabled environments, etc.
- 3. **Accessibility:** As you might have guessed, this metric is a measure of how accessible your website is, across a plethora of accessibility features that can be implemented in your page (such as the 'aria-' attributes like aria-required, audio captions, button names,

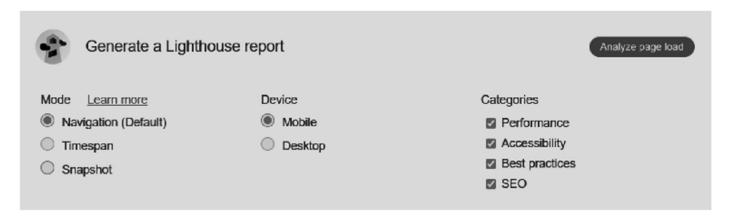

- etc.). Unlike the other metrics though, Accessibility metrics score on a pass/fail basis
- i.e. if all possible elements of the page are not screen-reader friendly (HTML5 introduced features that would make pages easy to interpret for screen readers used by visually challenged people like tag names, tags such as <section>, <article>, etc.), you get a 0 on that score. The aggregate of these scores is your Accessibility metric score.
- 4. **Best Practices:** As any developer would know, there are a number of practices that have been deemed 'best' based on empirical data. This metric is an aggregation of many such points, including but not limited to:Use of HTTPS

Avoiding the use of deprecated code elements like tags, directives, libraries, etc.

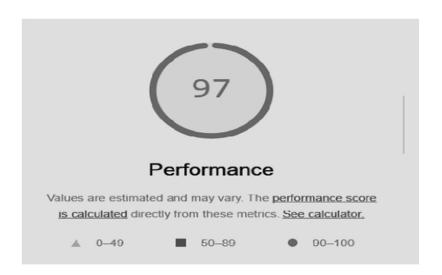

Password input with paste-into disabled

Geo-Location and cookie usage alerts on load, etc.

## **Screenshots:**

The performance of a Progressive Web App (PWA) was evaluated using the **Google Lighthouse** tool. Lighthouse is an open-source, automated tool used to improve the quality of web pages. It audits performance, accessibility, best practices, and SEO, providing developers with detailed feedback and actionable suggestions.

The PWA was tested using Lighthouse, and the results showed excellent scores in **Performance (96)**, **Accessibility (100)**, and **Best Practices (93)**, while the **SEO score (82)** indicated areas that could benefit from improvement. These metrics help assess how well the application adheres to modern web development standards, offering insights into both the strengths and potential areas of optimization.

**Conclusion:** In this experiment, the Google Lighthouse PWA Analysis Tool was used to evaluate the functioning of a Progressive Web App. The tool provided comprehensive insights into SEO, accessibility, and best practices. It helped identify areas for improvement and ensured the application adheres to modern web standards, resulting in a more optimized, user-friendly, and reliable web experience.
